Chapter 3: Conditional Statements

Conditional statements run code only when a condition is true. The if statement checks a condition, elif checks another one if the first was false, and else runs when nothing matched. Conditions use comparison operators such as ==, !=, <, > and >=.

```
marks = 62
if marks >= 50:
    print('pass')
else:
    print('fail')
```

Chapter 3: Conditional Statements

You can combine conditions with and, or and not. The elif branch runs only when every earlier if or elif was false. Only the first true branch in the chain is executed.

```
if age > 18 and has_id:
    print('allowed')
elif age > 12:
    print('teen')
```
